

Background to the Problem

Gadgets like smartphones and laptops have become essential tools for everyone, leading to a rise in gadget shops everywhere, but the main problem these shops face is that they still rely on outdated, manual methods like notebooks and paper receipts to manage their daily operations. As the business grows, keeping track of sales and inventory by hand becomes difficult and leads to common human errors such as miscalculations, lost records, and inaccurate stock levels. This lack of a proper system makes it hard for shop owners to know what is selling well or when to restock, and it causes delays that frustrate customers who expect fast service. Ultimately, without a digital solution, these shops struggle to work efficiently, lose track of their data, and fail to compete in a demanding market.
